Delhi, India | [+91-6230707124](tel:+91-6230707124) | aryamsharma.dev@gmail.com | linkedin.com/in/aryamsharma | github.com/aryam643 | aryamsharma.vercel.app

Professional Summary

SDE with 1.5 years shipping production backend systems across Django, PostgreSQL, Redis, and Celery. Experience spans async event pipelines, concurrency-safe data models, third-party API integrations, and low-latency systems programming in C++.

Education

Jaypee University of Information Technology
B.Tech in Computer Science Engineering | CGPA: 8.66/10.0

Solan, India
Sept. 2021 – May 2025

Professional Experience

Software Development Engineer

Sept. 2025 – Present

FellaFeeds

Remote

- Platform Backend
- Own backend across 10+ modules of a Django customer experience platform (Feedback, Reviews, Loyalty, Referrals, QR, Tickets); reduced API response times through query tuning, composite indexing, and Redis caching.
- Built OCR-based review verification pipelines with platform detection, match scoring, and failure diagnostics; implemented OTP login, nonce validation, and rate limiting for visitor and review auth flows.
- Migrated legacy workflows into scalable Django services, resolving complex PostgreSQL migrations with zero production data loss.
- Indofast CRM (Client Project)
- Architected a full-stack CRM on Django + PostgreSQL + React managing 6,000+ live leads, with JWT auth, RBAC across Agent/Manager/Admin roles, and geography-based lead routing.
- Automated Facebook Lead Ads ingestion via Meta webhooks and Graph API v19.0 with Celery async workers; designed a tiered duplicate-resolution policy using `select_for_update` to serialize concurrent webhook writes, with immutable `registered_at` and separate SLA clock fields.
- Integrated Ozonetel Click2Call and Web JS SDK as a WebRTC softphone for browser-based calling with inbound webhook handling.

Software Product Developer Intern

Jan. 2025 – Aug. 2025

TT Consultants

Mohali, India

- Migrated 3 legacy TCL modules (5,000+ lines) to Django, eliminating recurring production issues and consolidating duplicated business logic into reusable services.
- Built full-stack features with Django REST APIs and PostgreSQL supporting workflows for 200+ internal users.

Technical Projects

MBP-10 Orderbook Reconstruction | C++17, STL, Data Structures

GitHub

- Low-latency engine converting Market-by-Order streams to Market-by-Price snapshots, sustaining 100,000+ order updates/sec.
- Implemented price-level aggregation with $O(\log n)$ insert/update via ordered maps, sequence gap integrity checks for dropped and out-of-order messages, and memory-optimized order tracking with minimal heap allocation on the hot path.

BSM – Battery Dispatch & Traceability Portal | Django, DRF, PostgreSQL, Redis, React

- Built a 7-stage allocation state machine across 4 roles for EV battery dispatch, supporting partial fulfillment and proof-of-delivery capture.
- Designed a cascading custody resolver (exact match → suffix match → GPS proximity) for messy alphanumeric battery IDs, plus fuzzy city normalization with `rapidfuzz` handling typos, pincodes-as-city-names, and word-order variants.

Technical Skills

Languages: Python, C++, SQL, JavaScript, TypeScript

Frameworks: Django, DRF, Celery, FastAPI, Flask, React, Next.js, Node.js, Express.js

Databases: PostgreSQL, Redis, MySQL, MongoDB, SQLite

Infrastructure: AWS, Docker, Nginx, Jenkins, GitHub Actions, Git

Practices: System design, REST API design, async task pipelines, unit testing, CI/CD, code review

Achievements

2nd Place, IEEE Hackathon – Presented a project on detecting and countering cyberbullying; awarded runner-up at JUIT IEEE Student Branch hackathon.
