Professional Summary

Backend-focused Software Development Engineer with 1.5+ years of experience building and shipping production systems using Python, Django, PostgreSQL, Redis, and Celery. Comfortable designing REST APIs, async pipelines, concurrency-safe models, and third-party integrations, with additional hands-on work in low-latency C++ systems and TypeScript/Node.js services.

Experience

Software Development Engineer Sep 2025 - Present
FellaFeeds *Remote*

- Own backend work across 10+ modules of a Django customer-experience platform covering Feedback, Reviews, Loyalty, Referrals, QR, and Tickets. Improved API latency through query tuning, composite indexes, and Redis caching
- Built OCR-based review verification pipelines with platform detection, match scoring, and failure diagnostics. Added OTP login, nonce validation, and rate limiting to strengthen visitor and review authentication
- Refactored legacy workflows into reusable Django services and handled complex PostgreSQL schema and data migrations with zero production data loss
- Designed and built Indofast CRM on Django, PostgreSQL, and React for 6,000+ live leads, including JWT auth, role-based access (Agent/Manager/Admin), and geography-based lead routing
- Automated Meta Lead Ads ingestion using webhooks and Graph API v19.0 with Celery workers. Implemented concurrency-safe duplicate resolution with PostgreSQL `select_for_update` row locking
- Integrated Ozonetel Click2Call and WebRTC softphone support for browser-based calling, including inbound webhook handling

Software Product Developer Intern Jan 2025 - Aug 2025
TT Consultants *Mohali, India*

- Migrated three legacy TCL modules (over 5,000 lines) to Django, removing recurring production issues and consolidating duplicated business logic into cleaner, reusable services
- Built Django REST APIs and PostgreSQL-backed features that supported day-to-day workflows for 200+ internal users

Projects

MBP-10 Orderbook Reconstruction Engine | *C++17, STL, Data Structures* GitHub

- Built a low-latency engine that reconstructs Market-by-Price snapshots from Market-by-Order streams, handling 100,000+ order updates per second with $O(\log n)$ price-level updates using ordered maps
- Added sequence-gap detection for dropped or out-of-order messages and kept order tracking memory-efficient to reduce heap activity on the hot path

Aperture - LinkedIn Voyager Profile API | *FastAPI, Python, GraphQL/Rest.li* GitHub

- Reverse-engineered LinkedIn Voyager GraphQL/Rest.li request flows to expose a typed FastAPI endpoint that turns profile URLs into clean JSON covering identity, experience, education, skills, and certifications
- Added session and CSRF handling, per-IP rate limiting, validation, health checks, structured errors, pytest coverage, and deployment configuration without relying on browser automation or third-party enrichment APIs

BSM - Battery Dispatch & Traceability Portal | *Django, DRF, PostgreSQL, Redis, React*

- Built a 7-stage allocation state machine across four roles for EV battery dispatch, with support for partial fulfillment and proof-of-delivery capture
- Designed a cascading custody resolver (exact match → suffix match → GPS proximity) for messy alphanumeric battery IDs, plus fuzzy city normalization using rapidfuzz

Education

Jaypee University of Information Technology Solan, India
B.Tech in Computer Science Engineering; CGPA: 8.66/10.0 *Sep 2021 - May 2025*

Technical Skills

Languages: Python, C++, SQL, JavaScript, TypeScript
Backend & Frameworks: Django, Django REST Framework, FastAPI, Celery, Flask, Node.js, Express.js, React, Next.js
Data & Infrastructure: PostgreSQL, Redis, MySQL, MongoDB, SQLite, AWS, Docker, Nginx, Jenkins, GitHub Actions
Engineering: REST API design, system design, async pipelines, concurrency control, testing, CI/CD, code review

Achievements

2nd Place, IEEE Hackathon - Built and presented a project on detecting and countering cyberbullying; finished as runner-up at the JUIT IEEE Student Branch hackathon
